

Petition: Organization of a Selective Waste Collection at the Public Beach

Recipient: Regional authorities responsible for waste management and environmental protection.

Subject: Request for the implementation of a specific collection system for aluminum, compostable organic waste, and glass bottles at the public beach.

Petition Text:

We, citizens concerned about protecting our environment and users of the public beach, wish to draw your attention to an urgent issue related to waste management in this natural space. Currently, waste such as aluminum, compostable organic waste, and glass bottles are systematically disposed of in bins intended for incineration, representing a loss of valuable resources and inadequate management of these recyclable and compostable materials.

To preserve our environment, reduce ecological impacts, and promote the recovery of these materials, we ask the regional authorities to establish a specific selective collection system at the public beach, including separate bins for:

- 1. **Aluminum:** which can be infinitely recycled while saving energy and resources.
- 2. **Compostable organic waste:** which could be transformed into compost for use in local agriculture.
- 3. **Glass bottles:** which can be effectively and ecologically recycled.

The implementation of this measure would contribute to:

- Reducing the amount of waste incinerated, thus limiting CO2 emissions and atmospheric pollutants.
- Raising awareness among users about the importance of sorting and waste reduction.
- Valuing recyclable and compostable materials by giving them a second life.

We also request the provision of clear signage and awareness campaigns to inform users about how this collection works and its benefits for the environment.

We hope you will heed our call and take the necessary measures to make our public beach cleaner, more sustainable, and more environmentally friendly.

By signing this petition, we affirm our commitment to better waste management and our desire to see our region become a model in terms of sustainability.
